| 6 | REVISION HISTORY | 52 |

2 Introduction

This document explains about serial protocol that is used to communicate between the Wireless Performance Analyzer application which is running on host PC and Performance Analyzer firmware which is running on the Atmel Evaluation kit. Atmel EVKs are pre-flashed with Performance Analyzer firmware. This application is targeted to evaluate various Atmel transceivers in terms of Packet Error Rate, Range etc. Wireless Performance Analyzer is an application (part of Studio) on host PC which connects to Atmel Evaluation kit using USB or UART interface. This application is used to configure various parameters like CSMA, Antenna Diversity, TX power, Rx sensitivity to evaluate transceiver. The format of the messages used to communicate is given below.

3 Scope

The scope of the document is to describe the frame format of the messages that are used for communication between the Wireless Performance Analyzer Application running on the host PC and Performance Analyzer Firmware on the kit. The following sections describe the messages and its definitions in detail.

4 Protocol

4.1 Message Format

The Performance Analyzer protocol uses a common message format for both directions of communication.

RX/TX message format:

| SOT | Msg Length | Protocol Id | Msg Id | Msg Payload | EOT |
|----------|------------|-------------|----------|------------------------|----------|
| (1 byte) | (1 byte) | (1 byte) | (1 byte) | (Msg Length – 2) bytes | (1 byte) |

The details of message format are presented below:

| Field | Size | Values | Description |
|-------------|--------|-----------|--|
| SOT | 1 byte | 0x01 | Start of the Transmission |
| Msg Length | 1 byte | 0- 255 | Length of the message including Protocol Id, Msg Id and Msg Payload |
| Protocol Id | 1 byte | 0x00-0xFF | Describes the protocol used TAL – 0x00 MAC– 0x01 etc Performance Analyzer is an application on TAL, so it has the |

| | | | |
|-------------|---------------------------|-----------|--|
| | | | protocol id as 0x00 |
| Msg Id | 1 byte | 0x00-0xFF | Describes what message sent. |
| Msg Payload | (Msg Length – 2) bytes | ... | Payload for the message. This does not includes Protocol Id and Msg Id |
| EOT | 1 byte | 0x04 | End of Transmission |

4.2 Message Identifier

The message identifier indicates what the message is all about. The interpretation of the data packet will depend on the message identifier. Wireless Performance Analyzer application which is running on host PC sends Request packets, which are received and interpreted by the Performance Analyzer firmware in the kit. The Performance Analyzer firmware then performs the necessary operations and sends a confirmation or response back to the Performance Analyzer application running on the host PC.

Request packet Identifiers are shown below:

| Message Type | Value | Description |
|------------------------|-------|--|
| IDENTIFY_BOARD_REQ | 0x00 | Identifies the connected board and get the details |
| PERF_START_REQ | 0x01 | Starting performance test in Range or PER mode |
| PERF_SET_REQ | 0x02 | Sets the various configuration parameters for the performance Test. (Note: Refer to Section 4.4 – “Performance test Configuration parameters” to get the details on various parameters types and values.) |
| PERF_GET_REQ | 0x03 | Gets the various configuration parameters for the performance Test. (Note: Refer to Section 4.4 – “Performance test Configuration parameters” to get the details on various parameters types and values.) |
| IDENTIFY_PEER_NODE_REQ | 0x04 | Allows to identify the remote node by blinking |
| CONT_PULSE_TX_REQ | 0x05 | Allows continuous wave pulse mode transmission from the radio transceiver in current channel |
| CONT_WAVE_TX_REQ | 0x06 | Requests to start continuous transmission in CW or PRBS mode in current channel |
| REGISTER_READ_REQ | 0x07 | Requests to read the value of the given register |

| | | |
|------------------------|------|--|
| | | address |
| REGISTER_WRITE_REQ | 0x08 | Requests to write the value into the given register address |
| REGISTER_DUMP_REQ | 0x09 | Dumps the register values of the given set of the register address |
| ED_SCAN_START_REQ | 0x0a | Starts the Energy Detection Scan stops automatically on completion |
| SENSOR_DATA_REQ | 0x0b | Requests to get the sensor data like battery voltage |
| PER_TEST_START_REQ | 0x0c | Starts the Packet Error Rate with current user settings |
| PEER_DISCONNECT_REQ | 0x0d | Initiates the disconnection with the peer node |
| SET_DEFAULT_CONFIG_REQ | 0x0e | All configurable parameters shall be set to their default values. |
| GET_CURRENT_CONFIG_REQ | 0x0f | Current values of all configurable parameters shall be read |
| RANGE_TEST_START_REQ | 0x50 | Starts the Range test with current user settings |
| RANGE_TEST_STOP_REQ | 0x52 | Stops the Range test |

Confirmations and response identifiers for the above requests are shown below:

| Message Identifier | Value | Description |
|------------------------|-------|--|
| IDENTIFY_BOARD_CONFIRM | 0x10 | Identifies the connected board and gives the details of board like MCU, Transceiver and FW version |
| PERF_START_CONFIRM | 0x11 | Starting performance test in Range or PER mode and |

| | | |
|----------------------------|------|--|
| | | gives the status and all configurable parameters |
| PERF_SET_CONFIRM | 0x12 | Sets the various configuration parameters for the performance Test |
| PERF_GET_CONFIRM | 0x13 | Gets the various configuration parameters for the performance Test |
| IDENTIFY_PEER_NODE_CONFIRM | 0x14 | Allows to identify the remote node by blinking |
| CONT_PULSE_TX_CONFIRM | 0x15 | Provide the status on completion of continuous wave pulse mode transmission from the radio transceiver in current channel |
| CONT_WAVE_TX_CONFIRM | 0x16 | Start continuous transmission in CW or PRBS mode in current channel and provide the status |
| REGISTER_READ_CONFIRM | 0x17 | Register Read status with the register value |
| REGISTER_WRITE_CONFIRM | 0x18 | Register write status with the register address |
| REGISTER_DUMP_CONFIRM | 0x19 | Dumps the register values of the given set of the register address |
| ED_SCAN_START_CONFIRM | 0x1a | Provides the time required for scan and Starts the Energy Detection Scan stops automatically on completion |
| ED_SCAN_END_INDICATION | 0x1b | Provides Energy values of all channels on completion of Energy detection |
| SENSOR_DATA_CONFIRM | 0x1c | Provides the information like Battery voltage and temperature. |
| PER_TEST_START_CONFIRM | 0x1d | Starts the Packet Error Rate with current user settings. |
| PER_TEST_END_INDICATION | 0x1e | Provides information like No. of transmitted frames, Received frames LQI and RSSI Value on successful completion of PER test |
| PEER_DISCONNECT_CONFIRM | 0x1f | Provides the result of peer Disconnect req |
| SET_DEFAULT_CONFIG_CONFIRM | 0x20 | Provides the result for the Set default config req |

| | | |
|------------------------------|------|---|
| GET_CURRENT_CONFIG_CONFIRM | 0x21 | Provides the result for the Get current config req |
| RANGE_TEST_BEACON_RESPONSE | 0x54 | Response Frame for the Beacon Transmitted from the Host Node |
| RANGE_TEST_BEACON | 0x55 | Beacon Frame Transmitted over the air in Range Test Mode |
| RANGE_TEST_MARKER_INDICATION | 0x56 | Marker Indication Frame which is sent when a button is pressed at the receptor end. The LQI and ED of the Marker Cmd is sent to the GUI |

4.3 Message payload Descriptions

The following sections explain the format of payloads of all the message types.

4.3.1 IDENTIFY_BOARD_REQ (0x00)

| Field | Type/ Size | Values | Description |
|--------------------|------------------------------|-----------|--|
| Start up parameter | unsigned integer / 1 byte | 0x00-0xFF | Start up parameter to identify the request. Default value id 0xaa |

4.3.2 IDENTIFY_BOARD_CONFIRM (0x10)

| Field | Type/ | Values | Description |
|-------|-------|--------|-------------|
|-------|-------|--------|-------------|

| | Size | | |
|------------------|---|-------------|--|
| Status | 1 byte | 0x00-0xFF | <p>Status of the request</p> <p>0x00 = SUCCESS</p> <p>Non zero = FAILURE, This board/port is not a Performance test pre-flashed board. User may need to manual check and flash the application.</p> <p>For error codes refer Section 4.5 – “Error codes”</p> |
| IC type | unsigned integer / 1 byte | 0x00 – 0x01 | <p>IC type on Kit.</p> <p>0x00 = MCU- TRX</p> <p>0x01 = SoC</p> |
| MCU/SoC name | Array of chars / -- (first byte of the array indicates the length) | -- | This represents the name of SoC or MCU used on the Kit based on the IC type parameter |
| Transceiver name | Array of chars / -- (first byte of the array indicates the length) | -- | This represents the name of the transceiver used on the kit. Ignore this field if IC type = SoC |
| Board name | Array of chars / -- (first byte of the array indicates the | -- | Name of Board/ kit used for Transmitter/Initiator node |

| | | | |
|--------------------|----------------------------------|-------------------------|---|
| | length) | | |
| MAC address | unsigned integer/ 8 bytes | 0x00000001 – 0xffffffff | MAC address of the Transmitter/Initiator node |
| FW version | Floating point value/ 4 bytes | Starts from - 1.0 | Current FW version on the Kit |
| Features supported | unsigned integer/4 bytes | 0x00000001 – 0xffffffff | Each bit set represents a particular feature is supported. Ex: If LSB-b0 is set it says channel selection option is available. |

4.3.3 PERF_START_REQ (0x01)

| Field | Type/ Size | Values | Description |
|------------|------------------------------|-----------|--|
| Start mode | unsigned integer / 1 byte | 0x01-0x02 | Start mode for the Performance test 0x01 = PER measurement mode 0x02 = Single node tests |

4.3.4 PERF_START_CONFIRM (0x11)

| | Type/ Size | Values | Description |
|--|---------------|--------|-------------|
|--|---------------|--------|-------------|

| | | | |
|-------------------------|------------------------------|--|--|
| Status | unsigned integer / 1 byte | 0x00-0xFF | Status of the PERF_START_REQ 0x00 = SUCCESS Non zero = FAILURE. For error codes refer Section 4.5 – “Error codes” |
| Start mode | unsigned integer / 1 byte | 0x01- 0x02 | Start mode in which the Performance test is started 0x01 = PER mode 0x02 =Single node test mode |
| Channel | unsigned integer / 1 byte | 11-26 for 2.4GHz 0- 10 for 868/915 Sub GHz band | The default channel in which the Performance test is started |
| Channel Page | unsigned integer / 1 byte | 0,2,5,16,17,18, 19 | The channel page in which the Performance test is started |
| TX Power dBm value | signed integer / 1 byte | -17dBm – 21dBm | TX power value in dBm |
| TX Power Register value | unsigned integer / 1 byte | 0x00 – 0x0f | TX power register value, if exists 0xff= does not exists for this kit, do not show it in GUI This field exists does not exist for AT86RF212B |
| CSMA | Boolean/ 1 byte | True/false | CSMA-CA default value True = enabled False = disabled |

| | | | |
|--------------------|-------------------------------|------------|--|
| Frame Retry | Boolean / 1 byte | True/false | Frame retransmission default value True = enabled False = disabled |
| ACK Request | Boolean / 1 byte | True/false | Ack Request default value True = enabled False = disabled |
| Rx desensitization | unsigned integer/ 1 byte / | True/false | Rx De-sensitivity default value 0xff= does not exists for this kit, do not show it in GUI 0x00- disabled 0x01 - enabled |
| RPC | unsigned integer/ 1 byte | 0x00- 0xff | RPC default value if it exists 0xff= does not exists for this kit, do not show it in GUI 0x00- disabled 0x01 - enabled |
| Antenna Diversity | unsigned integer/ 1 byte | 0x00- 0xff | Antenna diversity default value if it exists 0xff= does not exists for this kit, do not show it in GUI 0x00- enabled, 0x01- disabled, ANT A1/X2 selected 0x02 - disabled, ANT A2/X3 selected |

| | | | |
|---------------------------|------------------------------|--------------------------------|--|
| Transceiver state | unsigned integer/ 1 byte | 0x00- 0xff | Default transceiver state 0x08 = TRX OFF Single node tests 0x16 = RX AACK ON for PER test |
| No. of test frames | Unsigned integer/ 4 bytes | 0 – 4294967295($2^{32} - 1$) | Default test frames for PER test = 100. Ignore this field if start mode parameter is not equal to 0x01 |
| PHY frame length | unsigned integer/ 1 byte | 12 - 127 | Default PHY frame length = 20. Ignore this field if start mode parameter is not equal to 0x01 |
| Antenna Diversity on Peer | unsigned integer/ 1 byte | 0x00- 0xff | Antenna diversity default value if it exists 0xff= does not exists for this kit, do not show it in GUI 0x00- enabled, 0x01- disabled, ANT A1/X2 selected 0x02 - disabled, ANT A2/X3 selected |
| CRC Setting on Peer | Boolean/ 1 byte | TRUE/FALSE | Indicate whether Counting of packets with wrong CRC is enabled TRUE = enable FALSE = disable |
| Peer IC type | unsigned | 0x00 – 0x01 | IC type on Peer node. |

| | | | |
|-----------------------|---|-------------------------|--|
| | integer / 1 byte | | 0x00 = MCU- TRX 0x01- SOC Ignore this field if start mode parameter is not equal to 0x01 |
| Peer MCU/SoC name | Array of chars / -- (first byte of the array indicates the length) | -- | This represents the name of SoC or MCU used on Peer node based on the Peer IC type parameter Ignore this field if start mode parameter is not equal to 0x01 |
| Peer Transceiver name | Array of chars / -- (first byte of the array indicates the length) | -- | This represents the name of the transceiver used on Peer node. Ignore this field if IC type = SoC Ignore this field if start modes parameter is not equal to 0x01 |
| Peer Board name | Array of chars / -- (first byte of the array indicates the length) | -- | Board/ kit name of the Peer node |
| Peer MAC address | unsigned integer/ 8 bytes | 0x00000001 – 0xffffffff | MAC address of the Peer node |

4.3.5 PERF_SET_REQ (0x02)

| Field | Type/ | Values | Description |
|-------|-------|--------|-------------|
|-------|-------|--------|-------------|

| | Size | | |
|-----------------|--|---------------------|--|
| Parameter Type | unsigned integer / 1 byte | 0x00-0xFF | Parameter type that needs to be set. Types of parameter are defined in the table 1 |
| Parameter Value | Various (first byte indicates the length) | Parameter Specific. | The value to set for Performance test parameters |

Note: Refer to Section 4.4 - Performance test Configuration parameters to get the details on various parameters types and values.

4.3.6 PERF_SET_CONFIRM (0x12)

| Field | Type/ Size | Values | Description |
|-----------------|--------------------------------------|--------------------|--|
| Status | unsigned integer / 1 byte | 0x00-0xFF | Status of the PERF_SET_REQ 0x00 = SUCCESS Non zero = FAILURE and previous value should be retained. For error codes refer Section 4.5 – “Error codes” |
| Parameter Type | unsigned integer / 1 byte | 0x00-0xFF | Parameter type that had been set. Types of parameters are defined in the table 1 |
| Parameter Value | Various (first byte indicates the | Parameter Specific | The parameter value that has been set |

| | | | |
|--|---------|--|--|
| | length) | | |
|--|---------|--|--|

4.3.7 PERF_GET_REQ (0x03)

| Field | Type/ Size | Values | Description |
|----------------|------------------------------|-----------|------------------------|
| Parameter Type | unsigned integer / 1 byte | 0x00-0xFF | Parameter type to read |

4.3.8 PERF_GET_CONFIRM (0x13)

| Field | Type/ Size | Values | Description |
|-----------------|------------------------------|--------------------|---|
| Status | unsigned integer / 1 byte | 0x00-0xFF | Status of the PERF_GET_REQ 0x00 = SUCCESS Non zero = FAILURE and do not consider the following fields. For error codes refer Section 4.5 – “Error codes” |
| Parameter Type | unsigned integer / 1 byte | 0x00-0xFF | Parameter type that was requested to get. |
| Parameter Value | various | Parameter Specific | The value of the parameter value that was read |

4.3.9 IDENTIFY_PEER_NODE_REQ (0x04)

| Field | Type/ | Values | Description |
|-------|-------|--------|-------------|
|-------|-------|--------|-------------|

| | Size | | |
|------------|------------------------------|-----------|--|
| Dummy byte | unsigned integer / 1 byte | 0x00-0xFF | Dummy byte. It has no meaning Default value is 0xaa |

4.3.10 IDENTIFY_PEER_NODE_CONFIRM (0x14)

| Field | Type/ Size | Values | Description |
|--------|------------------------------|-----------|---|
| Status | unsigned integer / 1 byte | 0x00-0xFF | Status of the IDENTIFY_PEER_NODE_REQ 0x00 = SUCCESS, the Peer node has been identified Non zero = FAILURE, Not able to contact peer node. For error codes refer Section 4.5 – “Error codes”. This feature is available only if the start mode of the PERF_START_CONFIRM has a value 0x01(sec 1.3.4) |

4.3.11 CONT_PULSE_TX_REQ (0x05)

| Field | Type/ Size | Values | Description |
|------------|------------------------------|-----------|--|
| Dummy byte | unsigned integer / 1 byte | 0x00-0xFF | Dummy byte. It has no meaning Default value is 0xaa |

4.3.12 CONT_PULSE_TX_CONFIRM (0x15)

| Field | Type/ Size | Values | Description |
|--------|---------------------------|-----------|---|
| Status | unsigned integer / 1 byte | 0x00-0xFF | <p>Status of the CONT_PULSE_TX_REQ</p> <p>0x00 = SUCCESS, the continuous pulse wave transmission is done</p> <p>Non zero = FAILURE, Not done.</p> <p>For error codes refer Section 4.5 – “Error codes”.</p> |

4.3.13 CONT_WAVE_TX_REQ (0x06)

| Field | Type/ Size | Values | Description |
|----------------------|---------------------------|------------|---|
| Start stop parameter | Boolean / 1 byte | TRUE/FALSE | <p>This parameter indicates whether Continuous transmission has to start or stop the ongoing transmission.</p> <p>0x00 = Stop Continuous transmission</p> <p>0x01 = Start Continuous Transmission</p> |
| TX mode | unsigned integer / 1 byte | 0x00- 0x01 | <p>Indicates the mode in which Continuous Transmission should start.</p> <p>0x00 = CW- Continuous Wave</p> <p>0x01 = PRBS- Pseudo Random</p> |

| | | | |
|--|--|--|-----------------|
| | | | Binary Sequence |
|--|--|--|-----------------|

4.3.14 CONT_WAVE_TX_CONFIRM (0x16)

| Field | Type/ Size | Values | Description |
|----------------------|------------------------------|------------|---|
| Status | unsigned integer / 1 byte | 0x00-0xFF | Status of the CONT_WAVE_TX_REQ 0x00 = SUCCESS, the continuous wave transmission is started or stopped Non zero = FAILURE, Not done. For error codes refer Section 4.5 – “Error codes”. |
| Start stop parameter | Boolean / 1 byte | TRUE/FALSE | This same as Start stop parameter in the Req |
| TX mode | unsigned integer / 1 byte | 0x00- 0x01 | This is same as TX mode parameter in the Req |

4.3.15 REGISTER_READ_REQ (0x07)

| Field | Type/ Size | Values | Description |
|------------------|------------------------------|---|--|
| Register address | unsigned integer/ 2 bytes | 0x00- 0x3f – for regular transceivers 0x141- 0x16F for SoC | Address of the Register to be read. Valid range is based on the whether the kit has regular transceiver or SoC, for this information refer IC type parameter of IDENTIFY_BOARD_CONFIRM |

| | | | |
|--|--|--|-----------------------------|
| | | | (Sec 1.3.2) |
|--|--|--|-----------------------------|

4.3.16 REGISTER_READ_CONFIRM (0x17)

| Field | Type/ Size | Values | Description |
|------------------|------------------------------|---|---|
| Status | unsigned integer / 1 byte | 0x00-0xFF | Status of the REGISTER_READ_REQ 0x00 = SUCCESS, Non zero = FAILURE, Do not consider following fields. For error codes refer Section 4.5 – “Error codes”. |
| Register address | unsigned integer/ 2 bytes | 0x00- 0x3f – for regular transceivers 0x141- 0x16F for SoC | The address of the register that has been read |
| Register value | unsigned integer / 1 byte | 0x00- 0xFF | The value in the specified register address that has been read |

4.3.17 REGISTER_WRITE_REQ (0x08)

| Field | Type/ Size | Values | Description |
|------------------|------------------------------|---|--|
| Register address | unsigned integer/ 2 bytes | 0x00- 0x3f – for regular transceivers 0x141- 0x16F for SoC | The address of the register that has to be written |

| | | | |
|----------------|------------------------------|------------|---|
| Register value | unsigned integer / 1 byte | 0x00- 0xFF | Value to be written in the specified register address |
|----------------|------------------------------|------------|---|

4.3.18 REGISTER_WRITE_CONFIRM (0x18)

| Field | Type/ Size | Values | Description |
|------------------|------------------------------|---|--|
| Status | unsigned integer / 1 byte | 0x00-0xFF | Status of the REGISTER_WRITE_REQ 0x00 = SUCCESS, Non zero = FAILURE, Do not consider following fields. For error codes refer Section 4.5 – “Error codes”. |
| Register address | unsigned integer/ 2 bytes | 0x00- 0x3f – for regular transceivers 0x141- 0x16F for SoC | The address of the register that has been written |
| Register value | unsigned integer / 1 byte | 0x00- 0xFF | Value written in the specified register address |

4.3.19 REGISTER_DUMP_REQ (0x09)

| Field | Type/ Size | Values | Description |
|------------------------|------------------------------|---|---|
| Start register address | unsigned integer/ 2 bytes | 0x00- 0x3f – for regular transceivers 0x141- 0x16F for SoC | The start address of the register set that has to be read |

| | | | |
|----------------------|-------------------------------|---|--|
| End register address | unsigned integer / 2 bytes | 0x00- 0x3f – for regular transceivers 0x141- 0x16F for SoC | The end address of the register set that has to be read. The End register address Should be always greater than Start register address |
|----------------------|-------------------------------|---|--|

4.3.20 REGISTER_DUMP_CONFIRM (0x19)

| Field | Type/ Size | Values | Description |
|------------------------|---|---|---|
| Status | unsigned integer / 1 byte | 0x00-0xFF | Status of the REGISTER_DUMP_REQ 0x00 = SUCCESS, Non zero = FAILURE, Do not consider following fields. For error codes refer Section 4.5 – “Error codes”. |
| Start register address | unsigned integer/ 2 bytes | 0x00- 0x3f – for regular transceivers 0x141- 0x16F for SoC | The start address of the register set that has been read |
| End register address | unsigned integer / 2 bytes | 0x00- 0x3f – for regular transceivers 0x141- 0x16F for SoC | The end address of the register set that has been read. |
| Register values List | Array of register values/ (First byte of the array indicates the length) | -- | The list of register values that had been read. |

4.3.21 ED_SCAN_START_REQ (0x0A)

| Field | Type/ Size | Values | Description |
|-------------------|-----------------------------|--|---|
| Scan duration | unsigned integer/ 1 byte | 0x00- 0x0e | A value used to calculate the length of time to spend scanning each channel for ED |
| Channels Selected | Unsigned integer/4 bytes | 0x00000000-0x07FFF800 – Ghz band 0x00000000-0x000007FF – Subghz bands | A 32-bit value used to represent 32 channels, from 0-31. Assuming the lower byte is transmitted first to firmware. |

4.3.22 ED_SCAN_START_CONFIRM (0x1A)

| Field | Type/ Size | Values | Description |
|------------------------|-----------------------------|------------|---|
| Status | unsigned integer/ 1 byte | 0x00- 0xFF | Status of the ED_SCAN_START_REQ 0x00 = SUCCESS, ED scan started Non zero = FAILURE, Not started, do not consider following fields For error codes refer Section 4.5 – “Error codes”. |
| Scan time minutes part | unsigned integer/ 1 byte | 0x00- 0x32 | Minutes part of the approximate time to be taken to complete scan. If this value is ‘0’ means the scan may take less than 1 minute |

| | | | |
|------------------------|----------------------------|----|---|
| | | | |
| Scan time seconds part | Floating point/ 4 bytes | -- | Seconds part of the approximate time to be taken to complete scan. First three decimal point values shall give milliseconds value |

4.3.23 ED_SCAN_END_INDICATION (0x1B)

| Field | Type/ Size | Values | Description |
|-----------------------|---------------------------------------|--------|---|
| No of channels | unsigned integer/ 1 byte | 0- 16 | The no of channels scanned 16 for 2.4GHZ 10 for 868/915MHZ |
| Energy detection List | Array of ED values along with channel | -- | The list of Energy values in all channels found during the ED scan. Each element in the List is channel followed by ED value. No. of channels parameter indicates the No. of elements in the list. Refer 3.3.23.1 for details |

4.3.23.1 Energy detection List

| Field | Type/ Size | Values | Description |
|---------|---------------|--------|----------------------------|
| Channel | unsigned | 0- 26 | The channel number scanned |

| | | | |
|----------|------------------------------|-----------------|--|
| number | integer/ 1 byte | | 11- 26 for 2.4GHZ 0-10 for 868/915MHZ |
| ED value | signed integer/ 1 byte | -91dBm to -7dBm | The Energy detected in a channel during the ED scan. |

4.3.24 SENSOR_DATA_REQ (0x0B)

| Field | Type/ Size | Values | Description |
|------------|--------------------------------|-----------|--|
| Dummy byte | unsigned integer/ 1 byte | 0x00-0xFF | Dummy byte. It has no meaning Default value is 0xaa |

4.3.25 SENSOR_DATA_CONFIRM (0x1C)

| Field | Type/ Size | Values | Description |
|-----------------|--------------------------------|------------|--|
| Status | unsigned integer/ 1 byte | 0x00- 0xFF | Status of the SENSOR_DATA_REQ request. 0x00 = SUCCESS, Got the sensor data Non zero = FAILURE, do not consider following fields. For error codes refer Section 4.5 – “Error codes”. |
| Battery voltage | floating point/ | -- | Battery voltage of the current kit. The value shall be in volts |

| | | | |
|-------------|----------------------------|----|--|
| | 4 bytes | | |
| Temperature | floating point/ 4 bytes | -- | Temperature measured in the degrees Celsius. This field is available only for SoC which will be know by IC type parameter of the IDENTIFY_BOARD_CONFIRM(refer Sec1.3.2) |

4.3.26 PER_TEST_START_REQ (0x0C)

| Field | Type/ Size | Values | Description |
|------------|-----------------------------|-----------|--|
| Dummy byte | unsigned integer/ 1 byte | 0x00-0xFF | Dummy byte. It has no meaning Default value is 0xaa |

4.3.27 PER_TEST_START_CONFIRM (0x1D)

| Field | Type/ Size | Values | Description |
|--------|-----------------------------|-----------|--|
| Status | unsigned integer/ 1 byte | 0x00-0xFF | Status of the PER_TEST_START_REQ 0x00 = SUCCESS, PER test Initiated Non zero = FAILURE, Not initiated. For error codes refer Section 4.5 – “Error codes”. |

4.3.28 PER_TEST_END_INDICATION (0x1E)

| Field | Type/ Size | Values | Description |
|---------------------------|----------------------------------|------------------|---|
| Status | unsigned integer/ 1 byte | 0x00-0xFF | Status of the PER test. Sent on completion of PER test 0x00 = SUCCESS, PER test completed Non zero = FAILURE, Not able to contact remote node to get the test results after the completion of the test. Ignore following fields in this case. For error codes refer Section 4.5 – “Error codes”. |
| Average RSSI value | Signed integer/ 1 byte | | Indicates average RSSI value of the PER test |
| Average LQI value | unsigned integer/ 1 byte | 0x00- 0xFF | Indicates average LQI of the PER test |
| No. of frames transmitted | unsigned integer/ 4 bytes | 0x00- 0xFFFFFFFF | No. of frames transmitted from Transmitter node during the PER test |
| No. of frames received | unsigned integer/ 4 bytes | 0x00- 0xFFFFFFFF | No. of frames received by Receptor node during the PER test |
| Frame failures | unsigned integer/ 4 bytes | 0x00- 0xFFFFFFFF | No. of frames failed to be transmitted |

| | | | |
|-----------------------------|------------------------------|------------------|--|
| | 4 bytes | | |
| Frames w/o ACK | unsigned integer/ 4 bytes | 0x00- 0xFFFFFFFF | <p>No of transmitted frames didn't get the ACK from receptor.</p> <p>Ignore this field if ACK request parameter is disabled for the current PER test. Refer. ACK Request parameter in the PERF_START_CONFIRM in Sec 1.3.4.</p> <p>Value if disabled is 0xffffffff.</p> |
| Frames with Access failures | unsigned integer/ 4 bytes | 0x00- 0xFFFFFFFF | <p>No. of frames could not be transmitted due to CHANNEL_ACCESS_FAILURE. Ignore this field if CSMA is disabled for the current PER test. Refer. CSMA parameter in the PERF_START_CONFIRM in Sec 1.3.4.</p> <p>Value if disabled is 0xffffffff.</p> |
| Frames with wrong CRC | unsigned integer/ 4 bytes | 0x00- 0xFFFFFFFF | <p>No. of frames received with wrong CRC. Ignore this field if CRC setting on remote node is disabled for the current PER test. Refer CRC Setting on Peer parameter in the PERF_START_CONFIRM in Sec 1.3.4. Value if disabled is 0xffffffff.</p> |
| Test Duration | Floating point / 4 bytes | -- | Time taken to complete the PER test in seconds |
| Net data rate | Floating point / | -- | Net data rate for the test. |

| | | | |
|--|---------|--|--|
| | 4 bytes | | |
|--|---------|--|--|

4.3.29 PEER_DISCONNECT_REQ (0x0D)

| Field | Type/ Size | Values | Description |
|------------|-----------------------------|-----------|--|
| Dummy byte | unsigned integer/ 1 byte | 0x00-0xFF | Dummy byte. It has no meaning Default value is 0xaa |

4.3.30 PEER_DISCONNECT_CONFIRM (0x1F)

| Field | Type/ Size | Values | Description |
|--------|-----------------------------|------------|--|
| Status | unsigned integer/ 1 byte | 0x00- 0xFF | Status of the PEER_DISCONNECT_REQ 0x00 = SUCCESS, Peer is disconnected successfully. After this confirm, the nodes are again to open for new peer search. Non zero = FAILURE. For error codes refer Section 4.5 – “Error codes”. |

4.3.31 SET_DEFAULT_CONFIG_REQ (0x0E)

| Field | Type/ Size | Values | Description |
|-------|---------------|--------|-------------|
|-------|---------------|--------|-------------|

| | Size | | |
|------------|-----------------------------|-----------|--|
| Dummy byte | unsigned integer/ 1 byte | 0x00-0xFF | Dummy byte. It has no meaning Default value is 0xaa |

4.3.32 SET_DEFAULT_CONFIG_CONFIRM (0x20)

| Field | Type/ Size | Values | Description |
|-------------------------|------------------------------|--|--|
| Status | unsigned integer/ 1 byte | 0x00- 0xFF | Status of the SET_DEFAULT_CONFIG_REQ 0x00 = SUCCESS. Non zero = FAILURE. For error codes refer Section 4.5 – “Error codes”. |
| Channel | unsigned integer / 1 byte | 11-26 for 2.4GHz 0- 10 for 868/915 Sub GHz band | The default channel in which the Performance test is started |
| Channel Page | unsigned integer / 1 byte | 0,2,5,16,17,18, 19 | The channel page in which the Performance test is started |
| TX Power dBm value | signed integer / 1 byte | -17dBm – 21dBm | TX power value in dBm |
| TX Power Register value | unsigned integer / | 0x00 – 0x0f | TX power register default value, if exists 0xff= does not exists for this |

| | | | |
|--------------------|-------------------------------|------------|---|
| | 1 byte | | kit, do not show it in GUI This field does not exists for AT86RF212B transceiver |
| CSMA | Boolean/ 1 byte | True/false | CSMA-CA default value True = enabled False = disabled |
| Frame Retry | Boolean / 1 byte | True/false | Frame retransmission default value True = enabled False = disabled |
| ACK Request | Boolean / 1 byte | True/false | Ack Request default value True = enabled False = disabled |
| Rx desensitization | unsigned integer/ 1 byte / | True/false | Rx De-sensitivity default value 0xff= does not exists for this kit, do not show it in GUI 0x00- disabled 0x01 - enabled |
| RPC | unsigned integer/ 1 byte | 0x00- 0xff | RPC default value if it exists 0xff= does not exists for this kit, do not show it in GUI This field exists for AT86RF233 only 0x00- disabled |

| | | | |
|---------------------------|----------------------------------|--------------------------------|--|
| | | | 0x01 - enabled |
| Antenna Diversity | unsigned integer/ 1 byte | 0x00- 0xff | Antenna diversity default value if it exists 0xff= does not exists for this kit, do not show it in GUI 0x00- enabled, 0x01- disabled, ANT A1/X2 selected 0x02 - disabled, ANT A2/X3 selected |
| Transceiver state | unsigned integer/ 1 byte | 0x00- 0xff | Default transceiver state 0x08 = TRX OFF Single node tests 0x16 = RX AACK ON for PER test |
| No. of test frames | Unsigned integer/ 4 bytes | 0 – 4294967295($2^{32} - 1$) | Default test frames for PER test = 100. Ignore this field if start mode parameter is not equal to 0x01 |
| PHY frame length | unsigned integer/ 1 byte | 12 - 127 | Default PHY frame length = 20. Ignore this field if start mode parameter is not equal to 0x01 |
| Antenna Diversity on Peer | unsigned integer/ 1 byte | 0x00- 0xff | Antenna diversity current value if it exists and the peer is connected 0x00- enabled, 0x01- disabled, ANT A1/X2 |

| | | | |
|---------------------|--------------------|------------|---|
| | | | <p>selected</p> <p>0x02 - disabled, ANT A2/X3 selected</p> <p>Ignore this field if start mode parameter is not equal to 0x01</p> |
| CRC Setting on Peer | Boolean/ 1 byte | TRUE/FALSE | <p>Indicate whether Counting of packets with wrong CRC is enabled</p> <p>TRUE = enable</p> <p>FALSE = disable</p> <p>Ignore this field if start mode parameter is not equal to 0x01</p> |

4.3.33 GET_CURRENT_CONFIG_REQ (0x0F)

| Field | Type/ Size | Values | Description |
|------------|-----------------------------|-----------|---|
| Dummy byte | unsigned integer/ 1 byte | 0x00-0xFF | <p>Dummy byte. It has no meaning</p> <p>Default value is 0xaa</p> |

4.3.34 GET_CURRENT_CONFIG_CONFIRM (0x21)

| Field | Type/ Size | Values | Description |
|-------------------------|------------------------------|--|--|
| Status | unsigned integer/ 1 byte | 0x00- 0xFF | Status of the GET_CURRENT_CONFIG_REQ 0x00 = SUCCESS. Non zero = FAILURE. For error codes refer Section 4.5 – “Error codes”. |
| Channel | unsigned integer / 1 byte | 11-26 for 2.4GHz 0- 10 for 868/915 Sub GHz band | The current channel in which the Performance test is running now |
| Channel Page | unsigned integer / 1 byte | 0,2,5,16,17,18, 19 | The current channel page in which the Performance test is running now |
| TX Power dBm value | signed integer / 1 byte | -17dBm – 21dBm | Current TX power value in dBm |
| TX Power Register value | unsigned integer / 1 byte | 0x00 – 0x0f | Current TX power register value, if exists 0xff= does not exists for this kit, do not show it in GUI This field does not exists for AT86RF212B transceiver |
| CSMA | Boolean/ 1 byte | True/false | CSMA-CA current value True = enabled |

| | | | |
|--------------------|-------------------------------|------------|--|
| | | | False = disabled |
| Frame Retry | Boolean / 1 byte | True/false | Frame retransmission default value True = enabled False = disabled |
| ACK Request | Boolean / 1 byte | True/false | Ack Request current value True = enabled False = disabled |
| Rx desensitization | unsigned integer/ 1 byte / | True/false | Rx De-sensitivity current value 0xff= does not exists for this kit, do not show it in GUI 0x00- disabled 0x01 – enabled |
| RPC | unsigned integer/ 1 byte | 0x00- 0xff | RPC current value if it exists 0xff= does not exists for this kit, do not show it in GUI This field exists for AT86RF233 only. 0x00- disabled 0x01 - enabled |
| Antenna Diversity | unsigned integer/ 1 byte | 0x00- 0xff | Antenna diversity current value if it exists 0xff= does not exists for this kit, do not show it in GUI 0x00- enabled, 0x01- disabled, ANT A1/X2 |

| | | | |
|---------------------------|----------------------------------|------------------------------|---|
| | | | selected 0x02 - disabled, ANT A2/X3 selected |
| Transceiver state | unsigned integer/ 1 byte | 0x00- 0xff | Current transceiver state 0x08 = TRX OFF Single node tests 0x16 = RX AACK ON for PER test |
| No. of test frames | Unsigned integer/ 4 bytes | 0 – 4294967295($2^{32}-1$) | Current test frames for PER test = 100. Ignore this field if start mode parameter is not equal to 0x01 |
| PHY frame length | unsigned integer/ 1 byte | 12 - 127 | Default PHY frame length = 20. Ignore this field if start mode parameter is not equal to 0x01 |
| Antenna Diversity on Peer | unsigned integer/ 1 byte | 0x00- 0xff | Antenna diversity current value if it exists and the peer is connected 0x00- enabled, 0x01- disabled, ANT A1/X2 selected 0x02 - disabled, ANT A2/X3 selected Ignore this field if start mode parameter is not equal to 0x01 |

| | | | |
|---------------------|----------------------------|-----------------|---|
| CRC Setting on Peer | Boolean/ 1 byte | TRUE/FALSE | <p>Indicate whether Counting of packets with wrong CRC is enabled currently</p> <p>TRUE = enable</p> <p>FALSE = disable</p> <p>Ignore this field if start mode parameter is not equal to 0x01</p> |
| ISM frequency | Floating point/ 4 bytes | 2322.0 – 2527.0 | <p>Indicates the ISM frequency in which transceiver currently being operated. range.Ex:2323.5,2526.0 etc</p> <p>This field is valid only</p> <p>If Transceiver is AT86RF233 and channel parameter(of this CONFIRM) is equal to 0xff only, ignore this field otherwise</p> |

4.3.35 RANGE_TEST_START_REQ (0x50)

| Field | Type/ Size | Values | Description |
|------------|-----------------------------|-----------|---|
| Dummy byte | unsigned integer/ 1 byte | 0x00-0xFF | <p>Dummy byte. It has no meaning</p> <p>Default value is 0xBB</p> |

4.3.36 RANGE_TEST_START_CONFIRM (0x51)

| Field | Type/ Size | Values | Description |
|--------|------------------------------------|-----------|--|
| Status | unsigned integer/ 1 byte | 0x00-0xFF | Status of the RANGE_TEST_START_REQ 0x00 = SUCCESS, Range test Initiated Non zero = FAILURE, Not initiated. For error codes refer Section 4.5 – “Error codes”. |

4.3.37 RANGE_TEST_STOP_REQ (0x52)

| Field | Type/ Size | Values | Description |
|------------|------------------------------------|-----------|--|
| Dummy byte | unsigned integer/ 1 byte | 0x00-0xFF | Dummy byte. It has no meaning Default value is 0xCC |

4.3.38 RANGE_TEST_STOP_CONFIRM (0x53)

| Field | Type/ Size | Values | Description |
|--------|------------------------------------|-----------|--|
| Status | unsigned integer/ 1 byte | 0x00-0xFF | Status of the RANGE_TEST_STOP_REQ 0x00 = SUCCESS, Range test Initiated Non zero = FAILURE, Not |

| | | | |
|--|--|--|--|
| | | | initiated. For error codes refer Section 4.5 – “Error codes”. |
|--|--|--|--|

4.3.39 RANGE_TEST_BEACON_RESPONSE (0x54)

| Field | Type/ Size | Values | Description |
|-------------|-----------------------------------|-----------|---|
| PHY Payload | Array of unsigned integers/1 byte | 0x00-0xFF | The PHY Payload of the Range Test Beacon Response Frame which was received from the receptor node is sent to the Host application. Refer Table 3.3.42 |
| LQI-R | unsigned integer/1 byte | 0x00-0xFF | Postfix-R indicates, the LQI value detected at the remote node . |
| ED value- R | signed integer/1 byte | 0x00-0xFF | Postfix-R indicates, the ED value detected at the remote node . |
| LQI-h | unsigned integer/1 byte | 0x00-0xFF | Postfix-h indicates, the LQI value detected at the host node . |
| ED value- h | signed integer/1 byte | 0x00-0xFF | Postfix-h indicates, the ED value detected at the host node . |

4.3.40 RANGE_TEST_BEACON (0x55)

| Field | Type/ Size | Values | Description |
|-------------|-----------------------------------|-----------|--|
| PHY Payload | Array of unsigned integers/1 byte | 0x00-0xFF | The PHY Payload of the Range Test Beacon Frame which is transmitted over the air is sent to the Host application. Refer Table 3.3.42 |

4.3.41 RANGE_TEST_MARKER_INDICATION (0X56)

| Field | Type/ Size | Values | Description |
|-------------|-----------------------------------|-----------|---|
| PHY Payload | Array of unsigned integers/1 byte | 0x00-0xFF | The PHY Payload of the Range Test Marker Frame which was received from the receptor node on event of Button Press on receptor side, is sent to the Host application. Refer Table 3.3.42 |
| LQI | unsigned integer/1 byte | 0x00-0xFF | LQI of the received Marker Indication Frame |
| ED | signed integer/1 byte | 0x00-0xFF | ED Value of the received Marker Indication Frame |

4.3.42 PHY Payload for Range Test Beacon/Beacon Reply/Marker

| Field | Type/ Size | Values | | | Description |
|---------------------------|-------------------------|-----------|--------------|-----------|--|
| | | Beacon* | Beacon Reply | Marker | |
| Frame Length | unsigned integer/1 byte | 0x00-0x7F | 0x00-0x7F | 0x00-0x7F | The Length of the PHY payload which is sent over the air.(Including the FCS Field) |
| FCF | unsigned integer/2bytes | 0x00-0xFF | 0x00-0xFF | 0x00-0xFF | The two byte FCF occupies the first two octets of the MPDU.(0X8861 is the default used in the application) |
| Sequence Number-PHY | unsigned integer/1 byte | 0x00-0xFF | 0x00-0xFF | 0x00-0xFF | The one-octet sequence number following the FCF identifies a particular frame |
| PAN ID | unsigned integer/2bytes | 0x00-0xFF | 0x00-0xFF | 0x00-0xFF | Both Source and Destination PAN ID are same (Intra-PAN).(0XCAFE is the default PAN ID used in the application) |
| Destination Short Address | unsigned integer/2bytes | 0x00-0xFF | 0x00-0xFF | 0x00-0xFF | 16-bit Destination Short address |
| Source Short Address | unsigned integer/2bytes | 0x00-0xFF | 0x00-0xFF | 0x00-0xFF | 16-bit Source Short address |

| | | | | | |
|------------------------|--|------------------------------------|---|------------------------------------|---|
| CMD ID | unsigned integer/1 byte | 0X12 | 0X13 | 0X15 | 1 byte command ID to identify the type of frame(beacon/beacon reply/marker) |
| Sequence Number | unsigned integer/1 byte | 0x00-0xFF | 0x00-0xFF | 0x00-0xFF | The one-octet sequence number to Identify the range Test Beacon frame |
| Range Test Frame Count | Unsigned - 32 bit integer/ 4 bytes | 0 – 4294967295 ($2^{32} - 1$) | 0 – 4294967295 ($2^{32} - 1$) | 0 – 4294967295 ($2^{32} - 1$) | Indicates the Range Test Beacon frame count |
| Range Test Payload | Signed*/unsigned integer/2 bytes(only 1 byte for Marker) | 0X00 | 0X00-0XFF First Byte is Signed followed by unsigned integer Byte | 0XAA | The Range Test Beacon Frame has 0X00 in both the two fields and the receptor node fills these two bytes with ED and LQI value respectively .For Marker cmd it is a dummy value. |

*Beacon name is used to indicate periodic transmissions .IEEE 802.15.4 Compliant Data frame is used for all the above cases.

4.4 Performance test Configuration parameters

The following table shows the parameters that can be configured (written to kit) using the PERF_SET_REQ and can be read from the kit using PERF_GET_REQ.

| Parameter | Identifier | Type/ Size | Valid range | Default value | Description |
|-----------|------------|-----------------------------|-----------------------|---------------|---|
| Channel | 0x00 | unsigned integer/ 1 byte | 11-26 for 2.4GHz band | 21 | Indicates the physical channel on which the PER test is running |

| | | | | | |
|--------------------|------|--------------------------------|---|---|---|
| | | | 0 – 10 for 868/915 Sub GHz | 1 | |
| Channel Page | 0x01 | unsigned integer/ 1 byte | 0,2,16,17 for 2.4GHz band 0,2,5,16,17, 18,19 for 868/915 Sub GHz | 0 | Indicates the on which channel page currently PER test is running. This is to support high data rates |
| TX power in Reg | 0x02 | unsigned integer/ 1 byte | 0x00- 0x0F | 0 9 for EXT_PA enabled kits | Indicate the TX power setting in terms of TX_PWR register value |
| TX power in dBm | 0x03 | signed integer/ 1 byte | -17 dBm – 3 or 4 dBm | 3 or 4 dBm (depend on Transceive r) | Indicate the TX power setting in terms of dBm value |

| | | | | | |
|-------------------|------|-----------------------------|------------------|----------------------------|--|
| | | | 4dBm to 21dBm | 21for EXT_PA enabled kits | |
| CSMA | 0x04 | boolean / 1 byte | TRUE or FLASE | TRUE | Indicate whether CSMA-CA mechanism is enabled TRUE = enable FALSE = disable |
| Frame retry | 0x05 | boolean / 1 byte | TRUE or FLASE | FALSE | Indicate whether Frame Retransmission feature is enabled TRUE = enable FALSE = disable |
| ACK Request | 0x06 | boolean / 1 byte | TRUE or FLASE | TRUE | Indicate whether Auto ACK feature is enabled TRUE = enable FALSE = disable |
| Antenna Diversity | 0x07 | unsigned integer/ 1 byte | 0x00- 0x02 | 0 – non RF233 based boards | Indicates whether Antenna diversity on source node is enabled and antenna selected in |

| | | | | | |
|---------------------------|------|-----------------------------|------------------|--|--|
| | | | | 1- for RF233 based boards | <p>case of disabled</p> <p>0 = ant div enabled</p> <p>1= ant div disabled & ant1 i.e. A1/X2 is selected</p> <p>2= ant div disabled & ant2 i.e. A2/X3 is selected</p> |
| Antenna Diversity on Peer | 0x08 | unsigned integer/ 1 byte | 0x00- 0x02 | <p>0 – non RF233 based boards</p> <p>1- for RF233 based boards</p> | <p>Indicates whether Antenna diversity on source node is enabled and antenna selected in case of disabled</p> <p>0 = ant div enabled</p> <p>1= ant div disabled & ant1 i.e. A1/X2 is selected</p> <p>2= ant div disabled & ant2 i.e. A2/X3 is selected</p> |
| Desensitization | 0x09 | boolean / 1 byte | TRUE or FLASE | FALSE | <p>Indicate whether Receiver desensitization is enabled</p> <p>TRUE = enable</p> |

| | | | | | |
|--------------------|------|------------------------------|--|---|---|
| | | | | | FALSE = disable |
| Transceiver state | 0x0a | unsigned integer/ 1 byte | 0 - 5 | 0x16 for PER test 0x08 for Single node tests | Indicates the transceiver state RESET = 0x00 TRX_OFF = 0x08 PLL_ON = 0x09 RX = 0x16 SLEEP = 0x0f DEEP_SLEEP= 0x20 (only RF233 only) |
| CRC on Peer node | 0x0b | boolean / 1 byte | TRUE or FLASE | FALSE | Indicate whether Counting of packets with wrong CRC is enabled TRUE = enable FALSE = disable |
| No. of test frames | 0x0c | unsigned integer/ 4 bytes | 0 – 4294967295 ($2^{32} - 1$) | 100 | Indicates no. of packets to be transmitted for PER test |
| PHY frame length | 0x0d | unsigned integer/ 1 byte | 12- 127 | 20 | Length of frame to be used for PER test |
| RPC | 0x0e | boolean / 1 byte | TRUE or FLASE | TRUE | Indicate whether RPC feature is enabled. This parameter is exists only for RF233 transceiver |

| | | | | | |
|---------------|------|----------------------------|-----------------|----|---|
| | | | | | <p>only</p> <p>TRUE = enable</p> <p>FALSE = disable</p> |
| ISM frequency | 0x0f | Floating point/ 4 bytes | 2322.0 – 2527.0 | -- | <p>Indicates the ISM frequency in which transceiver should be operated. Only frequencies with multiples of 0.5 is allowed in the given range.Ex:2323.5,2526.0 etc</p> <p>This parameter is exists only for RF233 transceiver only</p> |

4.5 Error codes

| Error code | value | Description |
|-----------------------|-------|---|
| SUCCESS | 0x00 | Requested operation is completed successfully |
| INVALID_CMD | 0x20 | Invalid command identifier is given in the request |
| ED_SCAN_UNDER_PROCESS | 0x21 | Currently Energy Detection Scan is under progress, no requests are serviced |
| TX_UNDER_PROGRESS | 0x22 | Currently Transmission is under progress, no requests are serviced |

| | | |
|-----------------------------|------|--|
| CONT_WAVE_TX_UNDER_PROGRESS | 0x23 | Currently Continuous Wave transmission is under progress, no requests are serviced |
| NO_PEER_FOUND | 0x24 | No peer device found after peer search |
| UNABLE_TO_CONTACT_PEER | 0x25 | Unable to contact peer node |
| INVALID_ARGUMENT | 0x26 | Arguments in the request are wrong |
| VALUE_OUT_OF_RANGE | 0x27 | Argument/parameter value in the request is out of the range |
| INVALID_REGISTER_ORDER | 0x28 | Start register address should be lesser than the End register address |
| TRANSCEIVER_IN_SLEEP | 0x29 | Currently Transceiver in Sleep. |
| TRANSMISSION_FAILURE | 0x30 | Transmission to the Peer node is failed |
| RANGE_TEST_IN_PROGRESS | 0x31 | Indicates a PER Mode Range Test is in Progress |

5 Abbreviations

| | |
|----------|---|
| RPC | Reduced Power Consumption |
| CW | Continuous Wave |
| PRBS | Pseudo Random Binary Sequence |
| ED | Energy Detection |
| LQI | Link Quality Indication |
| RSSI | Received Signal Strength Index |
| CSMA- CA | Carrier Sense Multiple Access – Collision Avoidance |
| PER | Packet Error Rate |
| CRC | Cyclic Redundancy Check |
| PHY | Physical Layer |
| MCU | Micro Controller Unit |
| IC | Integrated Chip |
| SoC | System on Chip |
